

Thailand Venomous Snake Skulls – Fangs, Dentition

Full skeleton of a King Cobra. *Ophiophagus hannah*. The world's largest venomous snake grows to over 5 meters in length.

If you haven't yet been to the Queen Saovabha Memorial Institute ([Red Cross Snake Farm](#)) in Bangkok, it is well worth a trip. The fee, 200 THB for adults and 50 THB for children is reasonable.

Though I don't like the idea of seeing snakes in captivity for any reason, I go anyway because it's there. I just don't see the world changing to a snake friendly place, an animal friendly place, anytime soon. I figure by going to see the snakes there I'll learn something and my curiosity will be sparked. I figure I'll spend more time looking for snakes and documenting them at this site for others to learn about. Without keeping them in a tank.

Anyway – here they are, some of the most venomous snakes in Thailand – their skulls, and in some cases full skeletons.

White-lipped pit viper skull. *Trimeresurus albolabris*.

Russell's viper skull from Thailand. *Daboia russelii siamensis* (*Daboia siamensis*).

King cobra skull from Thailand. *Ophiophagus hannah*.

Skull of a monocled cobra in Thailand. *Naja kaouthia*.

Skull of Malayan pit viper in Thailand. *Calloselasma rhodostoma*.

Skull of banded krait in Thailand. *Bungarus fasciatus*.

If you haven't seen my YouTube channels, I have one named Thailand Snakes [here](#), and another one, my personal channel that I have put many more snakes at [here](#).
